

4-POINT SIDE-RESTING VEHICLE STABILIZATION

Follow the same basic procedures & precautions outlined in the 3-point side resting stabilization with exception of using 4 jack stands. Applying 2 jack stands at the passenger compartment as shown will allow for more involved extrication operations later. Orient stands in opposing directions to resist vehicle movement in forward and rearward direction

4-POINT SIDE-RESTING VEHICLE STABILIZATION & LIFT

The vehicle pictured to the left is 8" off the ground. 4-Point stabilization using 2 jack stands at passenger side of vehicle quickly and safely performed this maneuver without lift bags or any other lifting devices. As the jack stands raised the vehicle, cribbing & wedges were adjusted to maintain ground contact. This is a technician level operation requiring a thorough understanding of the equipment involved and it's proper application. The stands are oriented in such a manner as to restrict forward and rearward motion of the vehicle in addition to side to side movement. Redundant base restraints are a must as a safe back-up. Each situation may dictate unique precautions.
